

# Working Sets - L1

## Working Set 1

1) Define the following functions:

$f: \mathbb{Z} \times \mathbb{Z} \rightarrow \mathbb{Z}$   
 $f(x, y) = 2x + 3y$

$g: \mathbb{Z} \times \mathbb{R} \rightarrow \mathbb{Z}$   
 $g(x, y) = (x+y)/x + 3$

2) Define some functions that have the following type:

$f: \text{float} \rightarrow \text{bool}$   
 $g: ('a \rightarrow \text{bool}) \rightarrow 'b \rightarrow 'b \rightarrow 'b$

Comment what they do and call them with arbitrary arguments in order to express their functionality.

3) Write a function that calculates the minimum of three given numbers using only if-then-else expressions.

4) Given the code below, determine the type of  $h$  without using the REPL. What is the value of the last expression? Explain the phenomenon.

```
let h x = fun x -> x + 1;;  
h 6;;
```

5) Write a function that composes 3 functions given as arguments (4 arguments: 3 functions +  $x$ ). Call this function using lambda-functions.

# Working Set 2

1) Define the following functions:

$f: \mathbb{Z} \times \mathbb{R} \rightarrow \mathbb{R}$   
 $f(x, y) = x + 3y$

$g: \mathbb{R} \times \mathbb{R} \rightarrow \mathbb{R}$   
 $g(x, y) = x^y$

2) Define some functions that have the following type:

$f: \text{int} \rightarrow \text{bool}$   
 $g: \text{string} \rightarrow \text{int}$

Comment what they do and call them with arbitrary arguments in order to express their functionality.

3) Write a function that calculates the maximum of three given numbers using only if-then-else expressions.

4) Given the code below, what happens at the definition of function h without using the REPL. What is the value of the last expression? Explain the phenomenon.

```
let a = 1
let h x = x + a;;
let a = 3;;
h 6;;
```

5) Write a predicate that verifies whether a function received as an argument is even in a point x (2 arguments: a function + x). Search for what means predicate.

# Working Set 3

1) Define the following functions:

$f: \mathbb{Z} \times \mathbb{Z} \rightarrow \mathbb{Z}$   
 $f(x, y) = x + 3y$

$g: \mathbb{Z} \times \mathbb{Z} \rightarrow \mathbb{Z}$   
 $g(x, y) = x \% y$  (remainder)

2) Define some functions that have the following type:

$f: \text{bool} \rightarrow \text{int}$   
 $g: \text{char} \rightarrow \text{float}$

Comment what they do and call them with arbitrary arguments in order to express their functionality.

3) Write a function that calculates the median of three given numbers using only if-then-else expressions.

4) Given the code below, without using the REPL, determine the type of the last expression. Explain the phenomenon.

```
let h x y z = x + y - z;;  
let m = h 2;;  
m 6;;
```

5) In mathematics, the  $+$  operator was extended also to functions, where  $(f + g)(x) = f(x) + g(x)$ . Write a function that computes the sum of two functions (which is also a function). Write a more abstract function that also accepts a binary operator that is applied instead of  $+$ .

# Working Set 4

1) Define the following functions:

$f: \mathbb{Z} \times \mathbb{R} \rightarrow \mathbb{R}$   
 $f(x, y) = -6x - 2y$

$g: \mathbb{R} \times \mathbb{R} \rightarrow \mathbb{Z}$   
 $g(x, y) = x * y / (x + y)$

2) Define some functions that have the following type:

$f: \text{float} \rightarrow \text{int}$   
 $g: ('a \rightarrow 'b) \rightarrow ('a \rightarrow \text{bool}) \rightarrow 'a \rightarrow 'b \rightarrow 'b$

Comment what they do and call them with arbitrary arguments in order to express their functionality.

3) Write a function that calculates the absolute value of a real number using if-then-else expressions.

4) Given the code below, without using the REPL, determine the type of the last expression. What happens when calling h? Explain the phenomenon.

```
let h x = fun y -> fun z -> x*y;;  
h 1 2 ( );;
```

5) Write a function that receives the coordinates of two points ( 4 arguments ) and computes the line crossing those two points.
